Regulatory Next Steps in Addressing Pipeline Seam Weld Challenges

- **Introduction and History**
- **Regulatory Mandate and Recommendations**
- **Seam Study – Phase 1**
- **Seam Study – Phase 2**
- **Integrity Verification Process – Overview**
- **Regulatory Action – Status Update**

Introduction and History

- **U.S. PHMSA - Advisory Bulletins on ERW Seam Failures**
 - **Alert Notice – ALN-88-01 and ALN-89-01**
 - Advised operators and the public on factors contributing to operational failures of pipelines constructed prior to 1970 with Electric Resistance Weld (ERW) seams
- **Liquid Propane Pipeline Rupture – Carmichael, MS**
 - November 1, 2007
 - Fracture along LF-ERW seam
 - 2 fatalities and 7 injuries

**Incident #1 -
Carmichael, MS**

Introduction and History

- **Natural Gas Transmission Rupture – San Bruno, CA**
 - September 9, 2010
 - Failure of 30-inch diameter weld seams
 - Fracture along partial welded seam – 6 short pipe joints
 - 5 pups fabricated in 1956, did not meet pipe quality standards
 - 8 fatalities, many injured, 38 homes destroyed, 70 homes damaged

Incident #2 San Bruno, CA

Photograph of the 28-foot-long ruptured section of pipeline

U.S. Regulatory Mandate and Recommendations: *Pipeline Safety Act of 2011*

- **Pipeline Safety Act of 2011 - Section 23**
- **Verification of Records and Reporting**
 - Identify pipe segments with no records to verify Maximum Allowable Operating Pressure (MAOP) for all Gas Transmission steel pipe [Class 3, 4 and all High Consequence Areas (HCAs)]
- **Determination of MAOP**
 - Reconfirm MAOP for pipeline segments with insufficient records
- **Testing Regulations**
 - Requires conducting tests to confirm material strength of previously untested gas transmission steel pipelines in HCAs and operating pressure of +30% Specified Minimum Yield Strength (SMYS) that were not previously pressure tested

U. S. Regulatory Mandate and Recommendations: *NTSB Recommendations*

- ***NTSB P-09-01 "Comprehensive Study"*** – to identify actions that can be implemented to eliminate catastrophic longitudinal seam failures in ERW pipe
- ***NTSB P-09-02 "Implement Actions from Study Findings"***
- ***NTSB P-11-14 "Delete Grandfather Clause"*** – recommends all grandfathered pipe be pressured tested, including a "spike" test
- ***NTSB P-11-15 "Seam Stability"*** – recommends pressure test to 1.25 x MAOP before treating latent manufacturing and construction defects as "stable"
- ***NTSB P-11-17 "Piggable Lines"*** – Configure all lines to accommodate smart pigs, with priority given to older lines

U. S. Regulatory Mandate and Recommendations

- How much pipeline mileage will these mandates and recommendations effect?

Piggability: ILI Able vs Not Able

Part R	Total Miles	ILI Able	ILI Not Able
Class 1 - HCA	1,658	1,380	278
- non-HCA	234,851	146,035	88,816
Class 2 - HCA	1,409	1,152	257
- non-HCA	28,978	15,073	13,905
Class 3- HCA	15,850	10,469	5,381
- non-HCA	16,751	6,924	9,827
Class 4 - HCA	752	366	386
- non-HCA	209	112	97
TOTAL	300,458	181,511	118,947

Gas Transmission 2012 Annual Report data as of 7-1-2013

Summary of Gas Transmission (GT) Pipe

Location	Total GT Miles	% in HCA	GT HCA Miles	Non-HCA Miles
Class 1	237,756	0.7	1,660	236,096
Class 2	30,210	4.7	1,412	28,798
Class 3	32,613	48.6	15,854	16,759
Class 4	962	78.2	752	209
Total	301,540		19,678	281,862

Data as of 7-1-2013 from Part Q of Operator Annual Reports

Aging Infrastructure: % by Decade in USA

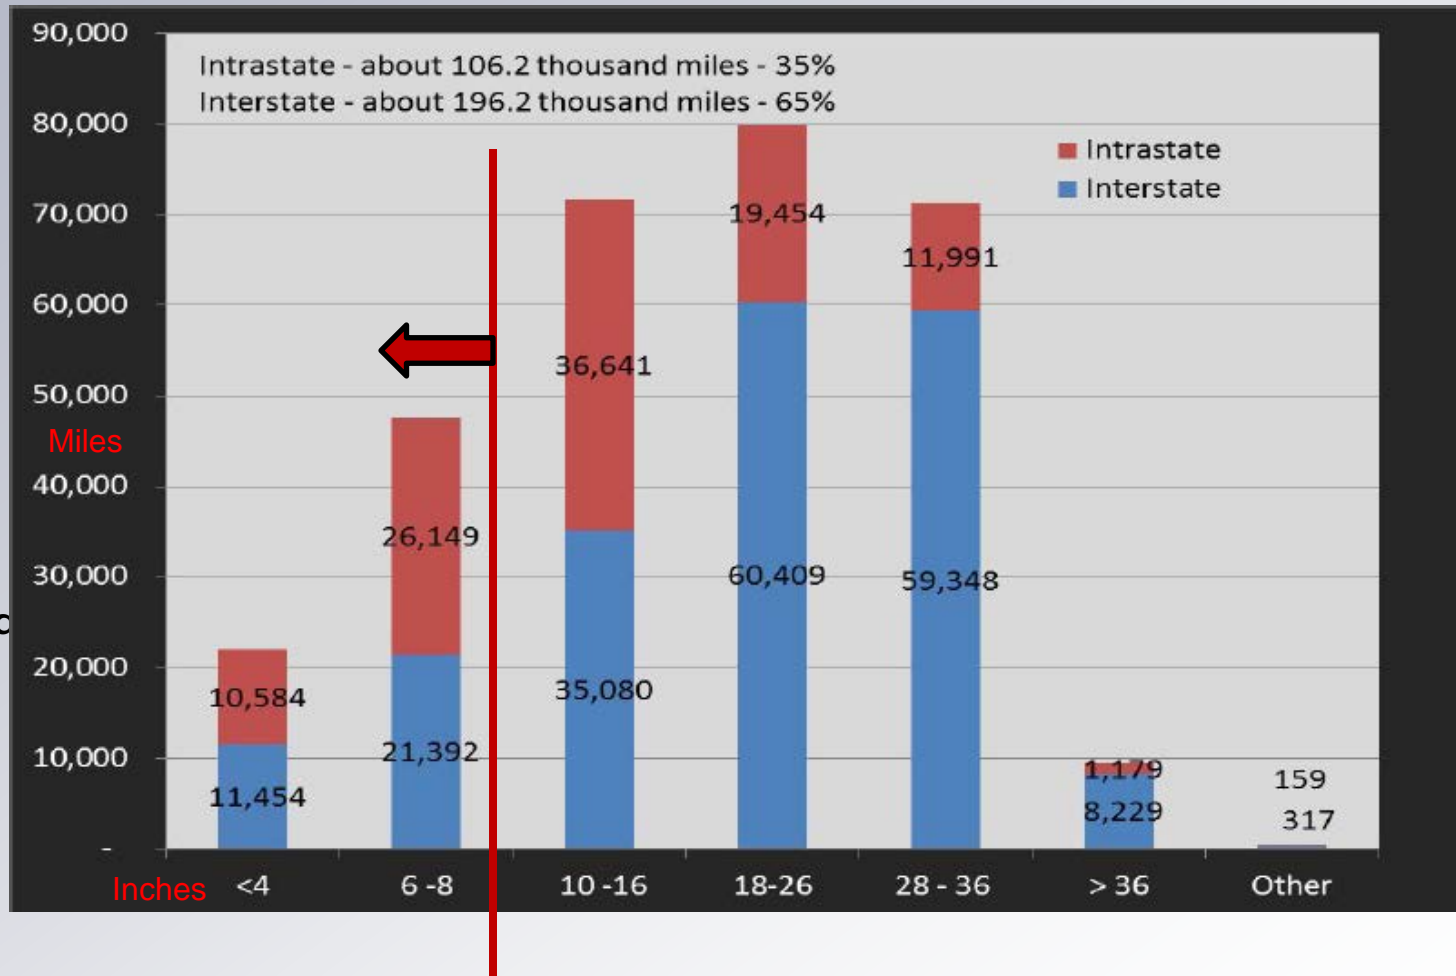

Decade	Hazardous Liquid	Gas Transmission	Gas Distribution Main	Service
Unknown & <1920	2%	---	---	---
1920s	2%	2%	---	---
1930s	3%	4%	6%	3%
1940s	8%	7%	2%	2%
1950s	20%	22%	10%	8%
1960s	21%	23%	17%	13%
1970s	16%	11%	12%	14%
1980s	9%	10%	14%	17%
1990s	11%	11%	21%	22%
2000s	8%	10%	18%	21%

Summary Data (Grouped by Decade):

- Hazardous Liquid:** 1920s-1960s: 56%; 1970s-2000s: 44%
- Gas Transmission:** 1920s-1960s: 58%; 1970s-2000s: 42%
- Gas Distribution Main:** 1920s-1960s: 47%; 1970s-2000s: 53%
- Service:** 1920s-1960s: 40%; 1970s-2000s: 60%

Nominal Pipe Size

Pressure Test Range

Pressure Test Range	Total Miles	% Total
PT < 1.1 MAOP or no PT	93,817	31%
1.25 MAOP > PT ≥ 1.1 MAOP	19,131	6%
PT ≥ 1.25 MAOP	187,628	62%

Gas Transmission 2012 Operator Annual Report data as-of 7-1-2013

Seam Study

Comprehensive Study to Understand Longitudinal ERW Seam Failures

- **Research Contractor: Phase 1**
 - Battelle
- **Subcontractors: Phase 1**
 - Det Norske Veritas (DNV) & Kiefner and Associates (KAI)
- **Principle Investigators: Phase 1**
 - Bruce Young – Battelle
 - Brian Leis & Bruce Nestleroth, in conjunction with
 - John Kiefner (KAI) & John Beavers (DNV)
- **Phase 1 Completed – Jan. 2014; Phase 2 underway**

Phase 1 – Findings

- **ILI Detection & Sizing:**
 - ILI results show inconsistencies with digs & hydro test results
 - May be due to either ILI tool findings or interpretation
 - ILI tools are useful for finding & eliminating some seam defects
- **In-the-Ditch Assessment Methods**
 - No consistent standard practice
 - Can be inspector dependent
- **In-the-Ditch / ILI Improvements required for:**
 - More specific identification of anomaly type
 - Reduction of false calls
 - Improved sizing of defect depth and length for effective assessment and evaluation results

Phase 1 – Findings

- **Failure Pressure Models**
 - Should use a more representative Charpy impact toughness position relative to the bond line
 - Toughness values when unknown, need to be conservative
- **Predictive Model for Assessing Failure Stress Levels**
 - Must be based upon whether the failure is brittle or ductile, if unknown evaluate for both
 - Must use lower-bound failure stress levels based upon defect type (cold weld, hook cracks, stress corrosion cracking, etc.)

Phase 1 – Findings

- **Hydrostatic test pressures**
 - Need to be higher to be effective based upon a review of over 600 seam failures
 - Time to failure increases at an exponential rate to increased test pressure
 - Higher test pressures should mean longer interval before a retest

Phase 2 – Overview

- 1. Improve hydrotesting protocols for ERW/FW Seams**
- 2. Enhance Defect Detection and Sizing via Inspection**
- 3. Defect Characterization: Types, Sizes, & Shapes**
- 4. Develop & Refine Predictive Models & Quantify Growth Mechanisms**
- 5. Develop Management Tools**
- 6. Public Meeting/Forum**

Completed reports for Phase 1 available at:

<https://primis.phmsa.dot.gov/matrix/PrjHome.rdm?prj=390>

Integrity Verification Process (IVP)

Overview of Basic Principles

Principle #1

Apply to Higher Risk Locations

- **High Consequence Areas (HCAs)**
- **Moderate Consequence Area (MCA):**
 - Onshore area within a potential impact circle
 - Containing one or more buildings intended for human occupancy
 - Occupied site or designated Federal interstate, expressway, or 4-lane highway right-of-way
 - Does not meet definition of high consequence area, as defined in § 192.903.
- **PHMSA Estimates**
 - ~ 76,000 miles HCA/MCA (out of ~ 301,000 miles)

Principle #2

Screen for Categories of Concern

- **Apply process to pipeline segments with:**
 - Grandfathered Pipe
 - Lack of Records to Substantiate MAOP
 - Lack of Adequate Pressure Test
 - Operating pressures over 72% SMYS (pre-Code)
 - History of Failures Attributable to Manufacturing & Construction Defects

Principle #3

Know & Document Pipe Material

- **Inadequate Validated, Non-traceable Material Documentation, Establish Material Properties by an approved process:**
 - Cut out and Test Pipe Samples (Code approved process)
 - *In Situ* Non-Destructive Testing (if validated and if Code approved)
 - Field verification of code stamp for components such as valves, flanges, and fabrications
 - Other verifications

Principle #4

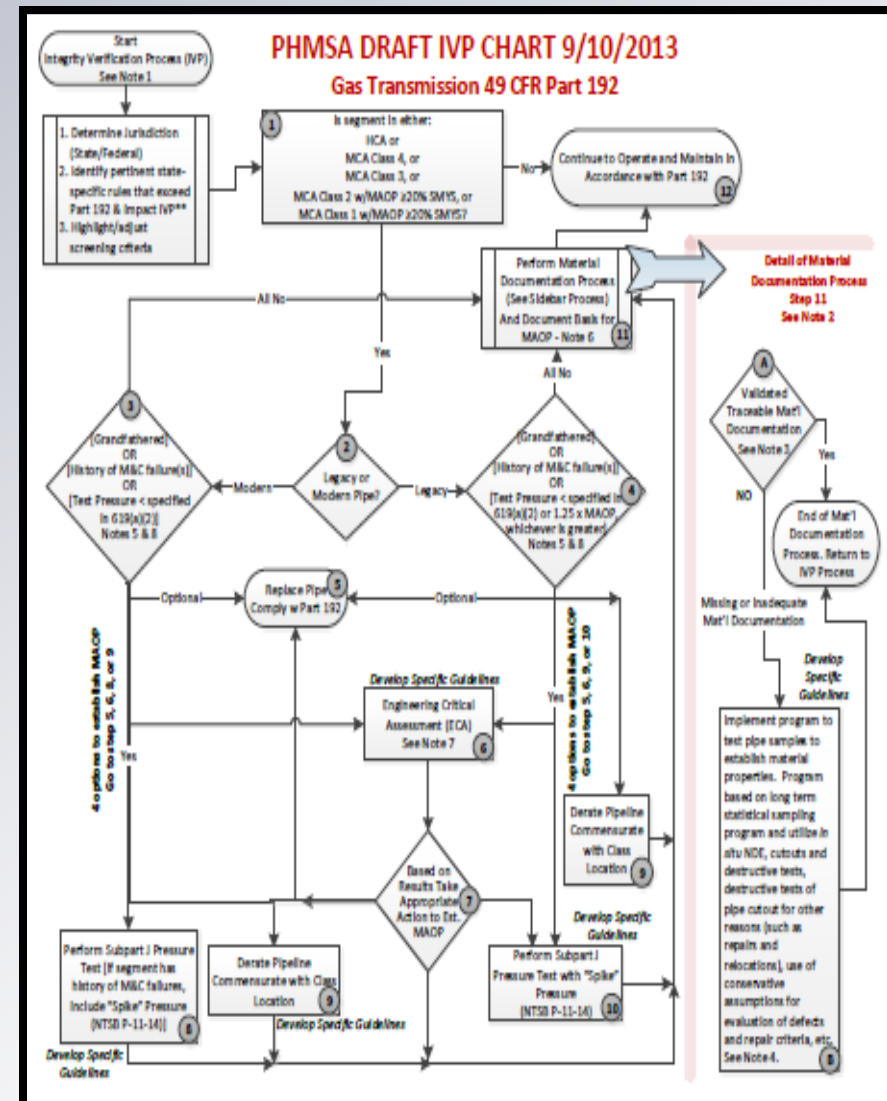

Assessments to Establish MAOP

- Allow Operator to Select Best Option to Establish MAOP
- **Candidate IVP Options for Establishing MAOP**
 - Subpart J Pressure Test with Spike Test
 - Derate Operating Pressure
 - Engineering Critical Assessment
 - Replace Pipe Segment
 - Alternative Technology or Technical Options
 - **Other options PHMSA should consider?**

Integrity Verification Process (IVP) Chart

- **Applicable Segments**
 - (Steps 1, 2, 3 and 4)
- **MAOP Determination**
Methods (Steps 5 – 10)
 - Pressure Test
 - Pressure Reduction
 - Engineering Critical Assessment (ECA)
 - Pipe Replacement
 - Pressure Reduction for Segments w/Small PIR
 - Alternative Technology
- **Materials Documentation (11)**
 - Destructive
 - Non-destructive
- **Continue Operations (12)**

Why are pipeline material records needed?

- To establish design and MAOP
- For integrity management (IM)
- Anomaly evaluations for safe operating pressure
- Record Types:
 - Materials
 - Design
 - Construction
 - Pressure Testing
 - Corrosion Control
 - O & M –
 - IM, Surveys, Patrols, Manuals, Procedures

CE MAX = 0.41%, PCM MAX = 0.21%

Hardness Analysis:

Temp	Shear 1 (%)	Shear 2 (%)	Shear 3 (%)	Shear Avg (%)
32 F	100	97	99	

Charpy Impact Analysis:

DirNotch	Spec Size	Temp	Fl lb1	Fl lb2	Fl lb3	Fl lb avg	Shear1 (%)	Shear2 (%)	Shear3 (%)	Shear Avg (%)
TBC	10x10 mm	32 F	128	133	173	145	100	100	100	100
THC	10x10 mm	32 F	110	115	112	112	100	100	100	100
TWC	10x10 mm	32 F	89	81	85	85	100	100	100	100

Fracture Toughness Criteria: As per API 5L, PSL2, SRSA @ 32 F, SRSS @ 30 F-32 F, SRB @ 30 F

The material has been manufactured, sampled, tested, and inspected in accordance with the spec/API5L and has been found to meet the requirements. DWG certify the above to be correct as contained in the records of the company.

Material Documentation Plan

- **Procedures**

- Tests for:

- Yield strength, ultimate tensile strength, seam type, coating type and chemistry

- Destructive Tests

- Pipe removed from replacements and relocations

- Destructive and/or Non-Destructive Tests

- Direct examinations, repairs, remediation & maintenance

- Tests used only to verify and document material grade

MAOP Determination

- **Applicable Locations**

- Located in HCA, MCA, and meets any of the following:
 - Experienced reportable in-service incident since last pressure test due...
 - Legacy pipe or constructed with legacy construction techniques and has not had a Pressure Test (PT) of the greater of
 - 1.25 times MAOP or applicable Class location PT requirement
 - No PT records
 - MAOP established per Grandfather Clause

MAOP Determination

- **Pressure Test**
 - 1.25 or class location test factor times MAOP
 - **Spike test segments** w/ reportable in-service incident due to legacy pipe/construction and cracking
 - Estimate remaining life, segments w/crack defects
- **Pressure Reduction**
 - Reduce pressure by MAOP divided by class location test factor
 - Estimate remaining life, segments w/crack defects
- **Pipe Replacement**
 - Install new pipe that meets Code requirements

MAOP Determination

- **Engineering Critical Assessment (ECA)**
 - ECA analysis – for MAOP
 - Segment specific technical and material documentation issues
 - Analyze crack, metal loss, and interacting defects remaining in pipe, or could remain in the pipe, to determine MAOP
 - MAOP established
- **Alternative Technology**
 - Alternative technical evaluation process that provides a sound engineering basis for establishing MAOP

Regulatory Action – Status Update

- **Notice of Proposed Rulemaking (NPRM)**
 - Regulation drafted
 - Being routed for approval to notice to Public
- **Applicable to Gas Transmission Pipelines**
 - 49 Code of Federal Regulations Part 192

Regulatory Next Steps in Addressing Pipeline Seam Weld Challenges
