Near misses...

Dresser Style 399 Nut not tightened

There is a slight gap on one of the compression nuts.

2" Polybutylene SDR 9 (1976) Crack from rock impingement Plunger hole day of investigation

Damage from Plunger Bar

Dresser Mech. Service Tee (1998) Slid off the tap hole due to ground shifting

The failure is due to an unreliable design.

Electrofusion Tee: Improper manual setting input into machine

Perfection Permasert Valve: Over turned breaking the valve stops

Mueller Insulating Riser Valve: <u>Not</u> caused by over tightening, manufacturers defect.

Excess Flow Valves

§192.381(d) <u>Service Lines: Excess flow valve performance</u> <u>standards</u> requires,

(d) An operator shall locate an excess flow valve as near as practical to the fitting connecting the service line to its source of gas supply.

i.e. at the main

What about 3rd Party Damage?

Federal Code CFR 190-192

Where do you install the flow Limiter?

At the location of where the damage occurred?

... or back at the main?

"<u>We agree with your understanding that if an excess flow value is</u> installed, it should be placed as near to the source of gas supply as practical to ensure the excess flow valve protects the maximum length of service line. An excess flow valve is required if the service line from the main to the customer's house, or a segment of service line near the fitting connecting the main to the service line (where an excess flow valve is usually located), is replaced. <u>However</u>, an excess flow valve is not required for replacement of short segments of service line far away from the main or source of supply because excess flow valves in those locations may not provide excavationdamage protection."
